COURIER MANAGEMENT SYSTEM (CMS)

1. USER STORY

Proposed Solution

The Courier Management System (CMS) is developed to manage courier and delivery operations efficiently using Salesforce. The system stores customer, shipment, delivery agent, branch, delivery update, and invoice information in a centralized platform. It helps administrators and staff track shipments, manage deliveries, maintain records, and generate reports and dashboards.

2. SALESFORCE ACCOUNT

Activity 1: Creating Developer Account

A Salesforce Developer Account is created to develop and configure the Courier Management System. The account provides access to Salesforce development tools and features required for creating objects, fields, relationships, validation rules, flows, profiles, roles, users, reports, and dashboards.

Activity 2: Account Activation

After creating the developer account, the registered email is verified and the Salesforce account is activated. The activated account is then used to access the Salesforce Developer environment.

3. OBJECT

Activity 1: Create Customer Object

A custom Customer__c object is created to store customer details such as customer name, email, phone number, and address.

Activity 2: Create Shipment Object

A custom Shipment__c object is created to maintain shipment information such as shipment ID, sender, receiver, shipment date, destination, and shipment status.

Activity 3: Create Delivery Agent Object

A Delivery_Agent__c object is created to store delivery agent information such as agent name, phone number, email, and assigned branch.

Activity 4: Create Branch Object

A Branch__c object is created to maintain branch details such as branch name, location, contact number, and branch manager.

Activity 5: Create Delivery Update Object

A Delivery_Update__c object is created to record shipment delivery updates such as current status, update date, location, and delivery remarks.

Activity 6: Create Invoice Object

An Invoice__c object is created to store invoice details such as invoice number, shipment, amount, payment status, and invoice date.

4. TABS

Activity 1: Creating a Tab for Customer Object

A custom tab is created for the Customer object to provide easy access to customer records.

Activity 2: Creating a Tab for Shipment Object

A Shipment tab is created to view, create, edit, and manage shipment records.

Activity 3: Creating a Tab for Delivery Agent Object

A Delivery Agent tab is created to manage delivery agent information and assigned delivery records.

Activity 4: Creating a Tab for Branch Object

A Branch tab is created to manage branch details and related information.

Activity 5: Creating a Tab for Delivery Update Object

A Delivery Update tab is created to record and monitor the latest shipment delivery status.

Activity 6: Creating a Tab for Invoice Object

An Invoice tab is created to manage invoice and payment-related information.

5. FIELDS & RELATIONSHIPS

Activity 1: Creation of Fields for Customer Object

Required fields are created in the Customer object to store customer name, email, phone number, address, and other relevant information.

Activity 2: Creation of Fields for Shipment Object

Fields are created to store shipment details including shipment number, customer, source, destination, shipment date, delivery date, and status.

Activity 3: Creation of Fields for Branch Object

Fields are created to maintain branch name, branch location, contact number, manager, and other branch details.

Activity 4: Creation of Fields for Delivery Agent Object

Fields are created to store delivery agent name, phone number, email, branch, and availability/status.

Activity 5: Creation of Fields for Delivery Update Object

Fields are created to record shipment status, update date, current location, delivery remarks, and related shipment information.

Activity 6: Creation of Fields for Invoice Object and Relationships

Invoice fields such as invoice number, shipment, amount, payment status, and invoice date are created. Relationships are established between related objects to connect customers, shipments, delivery updates, and invoices.

6. VALIDATION RULES

Activity 1: Create Validation Rules on Customer__c

Validation rules are created to ensure that required customer information is entered correctly and invalid or incomplete data is prevented.

Activity 2: Create Validation Rules on Shipment__c

Validation rules are applied to ensure that important shipment details such as destination, shipment date, and status are entered correctly.

Activity 3: Create Validation Rules on Delivery_Agent__c

Validation rules are created to ensure that valid delivery agent details, contact information, and required fields are entered.

Activity 4: Create Validation Rules on Invoice__c

Validation rules are used to ensure that invoice amount, invoice date, and payment status contain valid information.

Activity 5: Create Validation Rules on Delivery_Update__c

Validation rules are created to ensure that delivery updates contain valid shipment status, update date, and required information.

7. PAGE LAYOUTS

Activity 1: Edit Page Layout for Customer__c

The Customer page layout is customized by arranging important fields and sections for easy data entry and viewing.

Activity 2: Edit Page Layout for Shipment__c

The Shipment page layout is configured to display important shipment details and related information clearly.

Activity 3: Edit Page Layout for Delivery_Agent__c

The Delivery Agent page layout is customized to display agent information, contact details, and branch details.

Activity 4: Edit Page Layout for Branch__c

The Branch page layout is configured to display branch information and related details.

Activity 5: Edit Page Layout for Delivery_Update__c

The Delivery Update page layout is customized to display shipment status, update date, location, and remarks.

Activity 6: Edit Page Layout for Invoice__c

The Invoice page layout is configured to display invoice number, shipment, amount, payment status, and invoice date.

8. FLOWS

Activity 1: Auto-Update Shipment Status When Delivery Update is Created

A Salesforce Flow is created to automatically update the Shipment Status when a new Delivery Update record is created. This reduces manual work and keeps shipment information up to date.

9. THE LIGHTNING APP

Activity 1: Create a Lightning App

A Lightning App is created for the Courier Management System. The application provides centralized access to the required objects, tabs, records, reports, and dashboards.

10. PROFILE

Activity 1: Create a Custom Profile – Courier Admin

A custom Courier Admin profile is created with appropriate permissions to manage the complete courier management system.

Activity 2: Create a Custom Profile – Branch Manager

A Branch Manager profile is created with permissions required to manage branch-related operations and records.

Activity 3: Create a Custom Profile – Delivery Agent

A Delivery Agent profile is created to provide access to delivery-related records and updates.

Activity 4: Create a Custom Profile – Customer Support

A Customer Support profile is created to allow support staff to access and manage required customer and shipment information.

11. ROLE

Activity 1: Creation of Courier Admin Role

A Courier Admin role is created as the highest-level role in the system hierarchy.

Activity 2: Creating Branch Manager Role Under Courier Admin Role

The Branch Manager role is created under the Courier Admin role to establish a proper reporting hierarchy.

Activity 3: Creating Delivery Agent Role Under Branch Manager Role

The Delivery Agent role is created under the Branch Manager role to organize delivery operations.

Activity 4: Creating Customer Support Role Under Branch Manager

The Customer Support role is created under the Branch Manager role to manage customer support activities.

12. USER

Activity 1: To Create a User

Users are created in Salesforce by providing required information such as name, username, email, profile, and role.

Activity 2: Creating Other Users

Additional users are created for different roles such as Branch Manager, Delivery Agent, and Customer Support. Appropriate profiles and roles are assigned to each user.

13. REPORTS & DASHBOARDS

Activity 1: Create Report Types

Report types are created to define the objects and relationships from which report data can be collected.

Activity 2: Create Reports

Reports are created to analyze important courier information such as shipments, deliveries, customers, invoices, and delivery status.

Activity 3: Create Dashboard

A dashboard is created to provide a visual summary of important courier management information.

Activity 4: Add Dashboard Components

Different components such as charts, tables, and summary information are added to the dashboard to display important business data.

Activity 5: Save & Activate Dashboard

The dashboard is saved and activated so that authorized users can view updated courier management information.

CONCLUSION

The Courier Management System (CMS) successfully uses Salesforce to manage courier operations in a centralized and organized manner. Custom objects, fields, relationships, validation rules, page layouts, flows, profiles, roles, users, reports, and dashboards are configured to support the complete courier management process. The system improves data management, reduces manual work, and provides better visibility into shipment and delivery operations.
